

Postdoctoral Positions in Game Theory and Rationality

Game theory explores the rational basis of decision-making. It has had an important impact—through a fruitful exchange of concepts and tools—on such diverse areas as economics, mathematics, computer science, psychology, life sciences, cognitive sciences, business administration, law, philosophy, political science, and statistics.

The Center for the Study of Rationality, a world-leading multidisciplinary institution in these areas, is accepting outstanding candidates to its Postdoctoral Program.
